MusicRecord streaming audio from iTunes into Audacity, or route an audio stream from iTunes to Logic.. ApplicationsSince Soundflower offers a straight forward method of communicating between applications on the Mac, there are a variety of situations where you can employ it.. If you want an application to send and receive audio through Soundflower, (for instance using Max/MSP to manipulate and return another application's audio) you must send and receive the audio on different audio channels or a feedback loop will be created. CellphoneUse an application called DittyBot and Skype to access your iTunes collection from any cellphone.. To send the output of one application to another, select Soundflower as the output device in the first application and Soundflower as the input device within the second application.. The 16-channel device is provided for more complex routing situations, and can be used with more than two applications simultaneously if the applications support audio routing to any channel, as Max/MSP does.. PodcastingSoundflower has been used extensively in podcasting by combining separate streams of audio into one source.. Note that Soundflower's audio channels represent a global audio space If more than one application is sending its output to the same channel, the audio will be mixed. cea114251b [Wireshark 1.8.4 (64-bit Download For Mac](#)
